PROFESSIONAL SUMMARY

Data Analyst with 2+ years of experience turning raw operational and customer data into predictive models, KPI dashboards, and automated reporting. At Tunas Honda, built a repeat-purchase prediction model that cut marketing follow-up time and costs by about half, and a daily dashboard monitoring 50+ dealer branches. In local government, digitized 14+ manual, undocumented public services into an integrated ticketing system with real-time monitoring. Skilled in SQL, Python, A/B testing, and Google Apps Script; Informatics Engineering graduate (Cum Laude) and certified Associate Data Scientist.

WORK EXPERIENCE

IT Governance Specialist *Jun 2025 – Present*

Dinas Komunikasi, Informatika, Statistik dan Persandian Kabupaten Pesisir Barat

- Digitized 14+ public services that previously ran manually and undocumented, building a complaint intake system where each service records its data in a structured Google Sheet.
- Integrated all service sheets with Google Apps Script into a real-time monitoring dashboard, replacing a manual monthly report that took 4–5 hours to compile with always-current performance data per service and automatic flags for complaints not yet followed up.
- Built a Google Forms ticketing system that gives every complaint a unique ticket ID with trackable progress, plus automatic SLA calculation to monitor response times.
- Built a task-management dashboard to track staff workload, progress, and delays, and automated file naming and documentation on Google Drive.

Supervisor Marketing Data Analyst *Dec 2023 – May 2025*

PT Tunas Dwipa Matra (Tunas Honda) – Honda Motorcycle Main Dealer, Lampung

- Built a linear regression model in Python on 1M+ customer records to predict how many days until each customer's next purchase, letting the marketing team follow up only with customers whose repurchase date was approaching and cutting follow-up time and costs by about 50%.
- Built a daily dashboard (Google Sheets) monitoring customer app-registration targets across 50+ dealer branches in Lampung, reconciling sales records against Motoran app user data to flag dealers with unregistered customers.
- Cleaned and consolidated 1M+ customer records with incomplete and inconsistent fields, making the data usable for modeling and reporting.
- Analyzed market and customer behavior with Python, KNIME, and Excel, delivering weekly insight reports and recommendations to management.

Head of Treasury Staff & Mathematics Teacher *Sep 2020 – Mar 2023*

SMA Sains Wahid Hasyim

- Analyzed monthly learning outcomes of 90+ students to identify problem areas and designed data-informed teaching methods.
- Led financial planning and monthly reporting, including budget and payroll for 40+ staff.

SKILLS

Programming & Data: SQL (DuckDB), Python (pandas, NumPy, scikit-learn, statsmodels, Matplotlib), Google Apps Script
Machine Learning & Statistics: A/B testing, hypothesis testing, classification, regression, predictive modeling, exploratory data analysis
BI & Visualization: Power BI, Tableau, Looker Studio, KNIME, Excel, Google Sheets
Platforms & Tools: Microsoft Fabric, Google Workspace, Git/GitHub, Jupyter Notebook
Languages: Indonesian (native), English (professional working proficiency)

PROJECTS

Customer Repeat Order Prediction | Python, LightGBM, Streamlit
github.com/nabilakarimaazka/customer-repeat-order-prediction

- Built an end-to-end pipeline to rank 5,852 wholesale customers by their likelihood of reordering within 30 days (UCI Online Retail II, 2009–2011), using monthly time-based snapshots and 18 behavioral features to prevent data leakage.
- Compared a recency rule, logistic regression, and LightGBM; the selected LightGBM model achieved 2.45x lift in the top 20% (PR-AUC 0.569), and customers in the top 10% reordered at 68% vs. a 22% average.
- Turned predictions into a monthly High/Medium/Low follow-up list, estimated to need ~59% fewer contacts per reorder than contacting every customer, delivered through a Streamlit app with SHAP-based reasons for each customer.

Marketing A/B Test Analysis | Python, SQL (DuckDB), statsmodels

github.com/nabilakarimaazka/marketing-ab-test-analysis

- Analyzed a marketing A/B test of 588K users using SQL (DuckDB) and Python; after data quality and sample-ratio checks, a two-proportion z-test showed ads lifted conversion by 0.77 pp (2.56% vs 1.79%, +43% relative, $p < 0.001$).
- Implemented the z-test, confidence intervals, and power analysis from scratch and validated them against statsmodels; showed the test was well-powered (MDE 0.25 pp vs 0.77 pp observed lift) and quantified the design trade-off: a 50/50 split would be ~2.5× more sensitive but would forgo ~2,000 conversions.
- Ran 36 exploratory segment tests with Bonferroni correction; found the lift concentrated in high-exposure users (+3.8 pp) and flagged user engagement as a likely confounder, since conversion also rose with exposure in the control group; translated findings into a business memo recommending a frequency-cap experiment.

EDUCATION

Sunan Kalijaga State Islamic University — B.Eng. in Informatics Engineering *Sep 2019 – Jan 2023*

GPA: 3.55 / 4.00 (Cum Laude)
